With the world of electronics continually advancing, particularly the drive towards miniaturization, engineers and architects are constantly looking for ways to improve their designs. The tools used to develop an engineer's design will often depend on the complexity of the project. While very simple projects can be developed on a word processor or spreadsheet, complex projects are often developed using CAD software applications. CAD software applications are used to create three-dimensional (3D) models of the project in the form of drawings and solid modeling. To be able to physically produce the model, it is also necessary to prepare the drawings in the correct format. These include G-Code, as well as the description of the object and the way it is to be produced in 3D. These kinds of applications are also used by many other specialists, including: Construction and civil engineers Architects Mechanical engineers Chemical engineers Electrical engineers Civil engineers Biology and medical research Oil and gas engineers Education and science Engineers use CAD software to develop their designs. Engineers use AutoCAD to: Design complex projects, Work on complex projects, Have a design checked by others, Solve problems in design, Solve problems in manufacturing, Make 3D models of their design, Produce their 3D models, Produce a 3D model of their design. In the 1980s, CAD software developed from a strictly 2D design program into a 3D program. The original design of AutoCAD was specifically created for designers and engineers who were using the early version of the software. The original user interface of the application was designed to be as easy to use as possible, as it was going to be used by people who were not necessarily very experienced with computers. AutoCAD grew into a popular tool for 3D design. However, as computers became more affordable, the price of CAD software was lowered and people could buy their own computer, making the software more accessible to the average home user. Since then, there has been continuous development and improvement in the application. AutoCAD has made available a number of advanced capabilities to users. AutoCAD History AutoCAD was originally intended to

It is of significance to comprehensively study the properties of cell membranes, which

is one of the key issues in understanding the molecular level mechanisms of cell apoptosis. Bio-fullerenes are a new kind of fluorescent nanomaterials, which exhibit more unique and complicated luminescent properties than carbon dots (CDs). Moreover, CDs can be easily dispersed in water and biologically compatible. Thus, it is of great significance to understand the interfacial behaviors of cell membranes from the biological level. In this study, we constructed the bio-fullerene hydrophobic layer on a poly-L-lysine (PLL) surface using the self-assembling strategy, and a dextran-fructose-based material was used to trace the properties and applications of the interfacial behavior of cell membranes. We developed a facile method to synthesize PLL-biomolecules functionalized CDs based on a self-assembling strategy. The CD surface was immobilized with
